Social Media Performance Report

Digital Marketing Track — Task: Analyze a Social Media Performance Report
Prepared by: Sadhanala Nischay Prasad | Tools: Excel / Google Sheets

1. Objective & Dataset

The goal is to learn basic social media analytics by analysing a sample dataset and identifying the best and worst-performing posts. The dataset is a **synthetic sample** of 40 posts published between July and September 2026 across Instagram, Facebook, LinkedIn and Twitter/X. Each post records platform, post type, topic, posting time slot, reach, impressions, likes, comments, shares, saves and clicks.

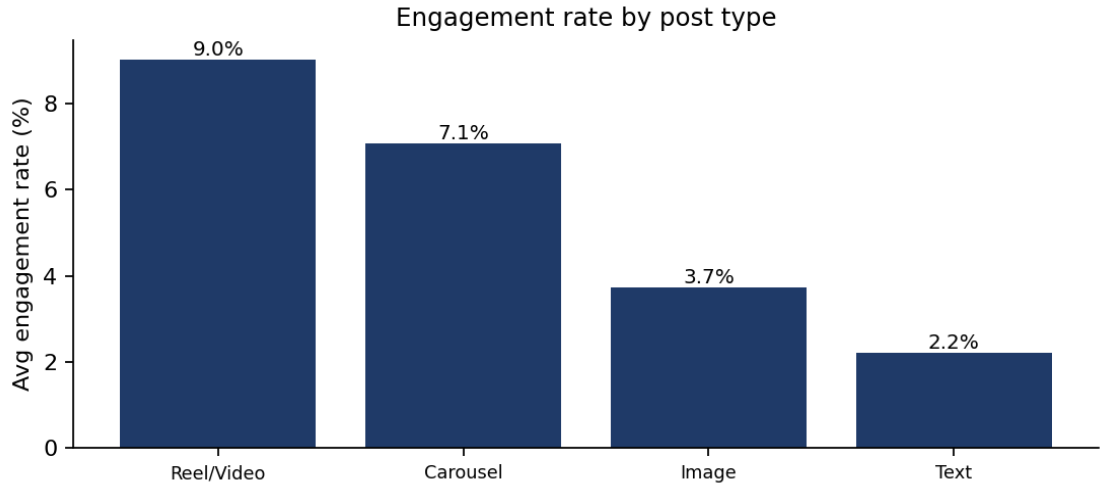

2. Metrics Used

Metric	Formula	What it tells us
Total Engagement	Likes + Comments + Shares + Saves	How much people interacted
Engagement Rate	Total Engagement ÷ Reach	Quality of a post — fair across reach sizes
CTR	Clicks ÷ Impressions	How well a post drives traffic
Frequency	Impressions ÷ Reach	How often each person saw the post

Posts are ranked by **engagement rate** rather than raw likes, because a post with big reach will always collect more likes; the rate shows how well the content actually worked.

3. Overall Performance

Posts	Total Reach	Total Impressions	Total Engagement	Total Clicks	Avg Eng. Rate	Avg CTR
40	263,696	413,428	17,994	7,918	5.93%	1.97%

4. Top-Performing Posts (by engagement rate)

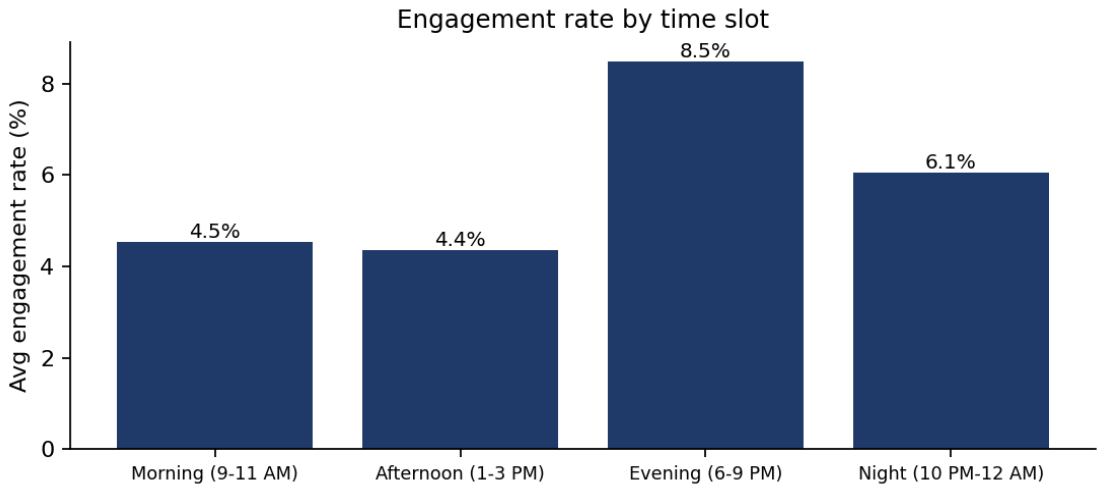

ID	Platform	Type	Topic	Time slot	Reach	Eng.	Eng. Rate	CTR
P004	Instagram	Carousel	Meme/Trend	Evening (6-9 PM)	12,168	1,657	13.62%	0.91%
P030	Twitter/X	Reel/Video	Meme/Trend	Evening (6-9 PM)	9,143	1,170	12.80%	1.67%
P039	Facebook	Reel/Video	Behind the Scenes	Evening (6-9 PM)	10,845	1,157	10.67%	2.00%
P002	LinkedIn	Reel/Video	Meme/Trend	Morning (9-11 AM)	4,134	410	9.92%	1.79%
P005	Twitter/X	Reel/Video	Festival Greeting	Evening (6-9 PM)	7,733	759	9.82%	1.53%

Every top post is a **Reel/Video or Carousel**, 4 of 5 were posted in the **evening**, and 3 of 5 are **Meme/Trend** content. P004 (Instagram carousel) leads with a 13.6% engagement rate and 266 saves.

5. Low-Performing Posts

ID	Platform	Type	Topic	Time slot	Reach	Eng.	Eng. Rate	CTR
P040	LinkedIn	Text	Offer/Discount	Morning (9-11 AM)	1,631	24	1.47%	2.61%
P008	Instagram	Text	Offer/Discount	Night (10 PM-12 AM)	5,839	105	1.80%	1.49%
P031	Facebook	Text	Behind the Scenes	Afternoon (1-3 PM)	2,528	46	1.82%	1.83%
P013	Twitter/X	Text	Tips & Tutorial	Morning (9-11 AM)	2,299	46	2.00%	1.64%
P026	LinkedIn	Text	Product Launch	Morning (9-11 AM)	1,590	34	2.14%	2.85%

All five weakest posts are **plain Text posts**, mostly in morning or afternoon slots. Even promotional topics (Offer/Discount, Product Launch) failed in text-only format, so the format — not the topic — is the main problem.

6. Engagement Insights

• **Format matters most.** Reels/Videos average 9.0% engagement, Carousels 7.1%, Images 3.7% and Text only 2.2% — video gets about 4x the engagement of text.

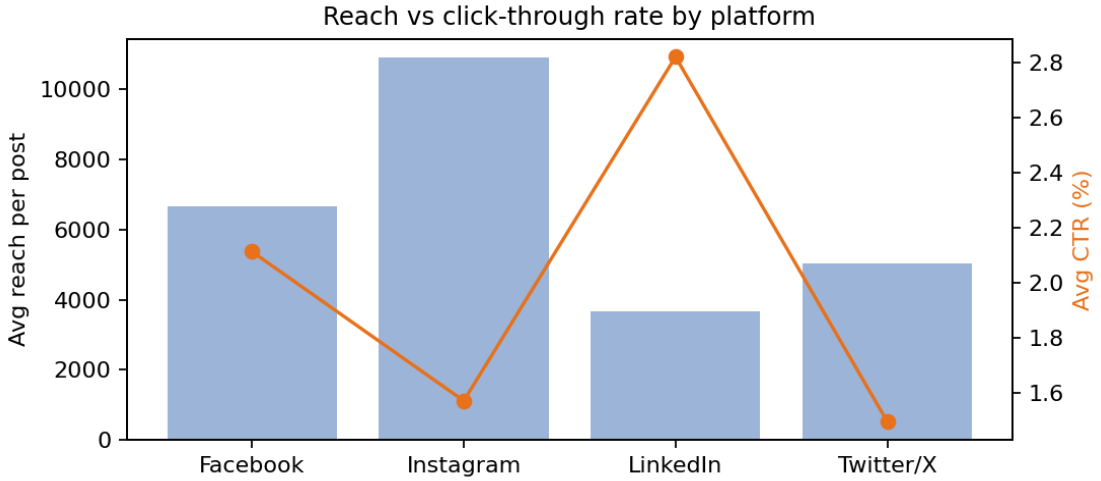

• **Carousels get saved.** Carousels average about 85 saves per post, the highest of any format — people bookmark useful, swipeable content.

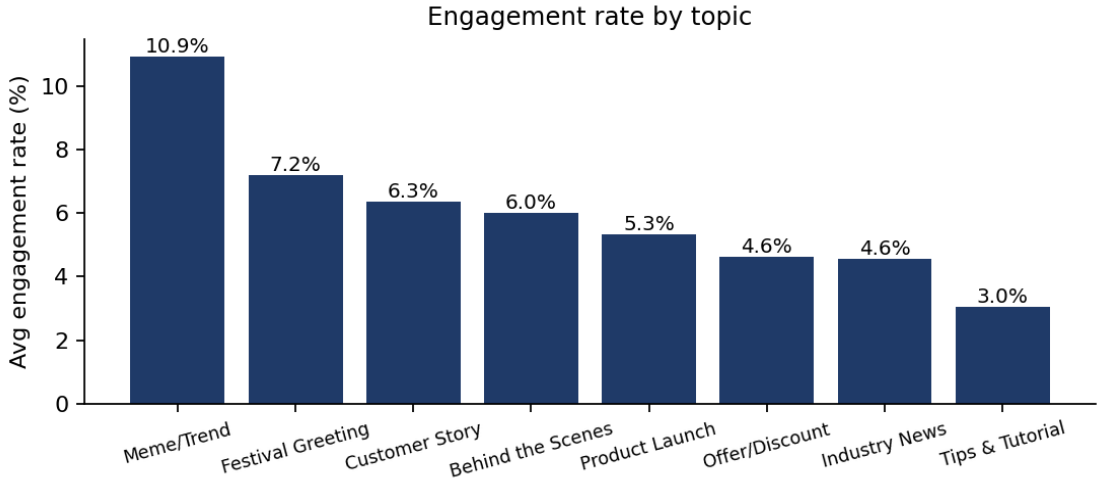

• **Evening wins.** Posts at 6–9 PM average 8.5% engagement, nearly double the afternoon slot (4.4%).

• **Reach vs clicks trade-off.** Instagram delivers the most reach (about 10.9K per post) but one of the lowest CTRs (1.6%); LinkedIn has the smallest reach but the best CTR (2.8%).

• **Trends travel.** Meme/Trend posts average 10.9% engagement; Industry News is among the weakest topics (4.6%). Tips & Tutorial scored low mainly because most were published as text.

• **Reach ≠ impressions.** Average frequency is about 1.57 — each person saw a post roughly 1.6 times, so impressions alone overstate audience size.

7. Three Recommendations

1. Shift the content mix to Reels and Carousels. Make them 60–70% of posts. Turn text posts (tips, offers, news) into short Reels or swipeable Carousels instead of dropping the topics.

2. Post key content between 6 and 9 PM. Schedule launches and offers in the evening window and avoid the 1–3 PM slot, which had the lowest engagement.

3. Match each platform to a goal. Use Instagram for reach and awareness; use LinkedIn and Facebook for traffic, with a clear call-to-action and link in every post, since they convert views into clicks best.

8. Limitations

The dataset is synthetic and small (40 posts), so some groups have only 2–5 posts (for example, Festival Greeting has 2). Results show patterns for learning purposes; a real account should test these recommendations over 4–8 weeks before committing.

9. Files

social_media_data.csv (raw data) • Social_Media_Performance_Analysis.xlsx (formulas, summary tables, charts, auto-updating top/bottom lists) • charts/ (PNG charts) • README.md
